

Sales Momentum Model (SMO)

Introduced in June 1996, Sales Momentum measures the acceleration or deceleration in the growth of sales (revenues) using the same calculation as is used in Earnings Momentum. The second derivative of a curve fit to the trailing 12-month sales ending each of the past five quarters is calculated to measure the acceleration or deceleration of the growth rate. In order to compensate for companies with erratic sales, the second derivative is then adjusted by a measure (standard error) of how well the curve fits the sales series. The Ford Universe is ranked from highest to lowest (100 to 1). A stock with a score of 70 or higher is considered a buy candidate, while one with a score of 30 or lower is a sell candidate.

Performance is based on ranking the Ford Universe from best to worst for the model shown and dividing it into 10 equal-sized groups each month. The group returns represent equal-dollar investments in each stock each month, with monthly total returns linked to create annual and annualized results. Total returns, which sum month-end price changes and 1/12 of companies' indicated annual dividend rates, exclude transaction costs and management fees. The Ford Universe had 4023 companies at the end of 2018.

Quantitative model results are affected by market environment and are based on historical financial data. Certain material information for a company may not be reflected in models presented. The performance shown is based on large portfolios and may not be effective on every security. There is no assurance that future results will duplicate past results.
